PSYCHOLOGICAL FACTORS OF MOTIVATION AND SELF-REGULATION IN STUDENTS' INDEPENDENT LEARNING ACTIVITIES

Ravshanov Khusan Abdiqul ugli

Independent Researcher, Bukhara International University

Ravshanov@gmail.com

Abstract. *This article examines the psychological factors of motivation and self-regulation in students' independent learning activities. In modern education, independent learning plays a crucial role in the development of professional competencies and lifelong learning skills. The study analyzes intrinsic and extrinsic motivation as well as the key components of self-regulation, including goal setting, planning, monitoring, and reflection. The findings indicate that students' success in independent learning largely depends on their ability to manage time effectively, apply appropriate learning strategies, and maintain self-control. Empirical results show that students with higher levels of intrinsic motivation demonstrate greater engagement and productivity in their learning process. Furthermore, well-developed self-regulation skills contribute to deeper knowledge acquisition and sustained learning motivation. The study highlights the importance of integrating psychological support mechanisms into educational practices to enhance the effectiveness of independent learning in higher education.*

Key words: *motivation, independent learning, self-regulation, intrinsic motivation, reflection, learning strategies, self-control.*

Annotatsiya. *Mazkur maqolada talabalarning mustaqil ta'lim faoliyatida motivatsiya va o'zini boshqarishning psixologik omillari tahlil qilinadi. Zamonaviy ta'lim tizimida mustaqil o'rganish jarayoni talabaning faolligi, ichki motivatsiyasi va o'z faoliyatini samarali boshqarish qobiliyatiga bevosita bog'liqdir. Tadqiqotda motivatsiyaning ichki va tashqi turlari, shuningdek, o'zini boshqarish (self-regulation) jarayonining asosiy komponentlari – maqsad qo'yish, rejalashtirish, monitoring va refleksiya keng yoritilgan. Talabalarning mustaqil ta'lim faoliyatida muvaffaqiyatga erishishi ularning o'z-o'zini nazorat qilish, vaqtni boshqarish va o'quv strategiyalarini to'g'ri tanlash qobiliyatiga bog'liqligi aniqlangan. Empirik tahlil natijalari motivatsiya darajasi yuqori bo'lgan talabalar mustaqil o'rganishda samaraliroq natijalarga*

erishishini ko‘rsatadi. Shuningdek, o‘zini boshqarish ko‘nikmalarining rivojlanganligi talabaning bilimlarni chuqur o‘zlashtirishiga va uzluksiz o‘rganishga moyilligini oshiradi. Tadqiqot natijalari oliy ta’lim tizimida mustaqil ta’lim samaradorligini oshirishga xizmat qiladi.

Kalit so‘zlar: *motivatsiya, mustaqil ta’lim, o‘zini boshqarish, ichki motivatsiya, refleksiya, self-regulation, o‘quv strategiyalari.*

Аннотация. *В данной статье рассматриваются психологические факторы мотивации и саморегуляции в самостоятельной учебной деятельности студентов. В условиях современного образования самостоятельное обучение становится важным компонентом формирования профессиональных компетенций. В исследовании анализируются внутренние и внешние виды мотивации, а также ключевые компоненты саморегуляции: постановка целей, планирование, контроль и рефлексия. Установлено, что успешность самостоятельного обучения зависит от уровня развития навыков самоконтроля, управления временем и выбора эффективных учебных стратегий. Результаты эмпирического анализа показывают, что студенты с высокой внутренней мотивацией демонстрируют более высокую активность и продуктивность в обучении. Также выявлено, что развитые навыки саморегуляции способствуют глубокому усвоению знаний и формированию устойчивой потребности в обучении на протяжении всей жизни. Практическая значимость исследования заключается в совершенствовании организации самостоятельной учебной деятельности студентов.*

Ключевые слова: *мотивация, самостоятельное обучение, саморегуляция, внутренняя мотивация, рефлексия, учебные стратегии, самоконтроль.*

Relevance of the Topic. The issue of psychological factors of motivation and self-regulation in students’ independent learning activities has become increasingly relevant in both national and global educational contexts due to rapid transformations in knowledge economies, digitalization, and the shift toward learner-centered education. In modern higher education systems, students are expected not only to acquire knowledge but also to independently manage their learning processes, which places motivation and self-regulation at the core of academic success.

At the international level, organizations such as OECD emphasize that student motivation and engagement are key predictors of academic achievement and lifelong learning readiness.

According to PISA 2022 findings, a significant proportion of students report confidence in managing their own learning, highlighting the growing importance of self-directed learning skills in global education systems . Furthermore, OECD reports underline that lifelong learning has become a strategic priority for countries, as it directly contributes to economic competitiveness, social well-being, and adaptability in rapidly changing labor markets . In this context, self-regulation and intrinsic motivation are viewed as essential competencies that enable individuals to continuously update their knowledge and skills.

UNESCO also identifies self-regulation, emotional intelligence, and motivation as fundamental components of quality education and sustainable development. The organization stresses that modern education should foster not only cognitive skills but also socio-emotional competencies that support autonomous learning and personal development . Additionally, the integration of digital technologies and artificial intelligence in education further increases the need for students to independently manage their learning, as personalized and flexible learning environments require higher levels of self-regulation .

Empirical research further confirms the importance of these factors. Studies indicate that self-regulated learning strategies significantly improve academic performance, especially in complex and independent learning tasks . Similarly, motivational regulation strategies are strongly associated with higher academic achievement and increased learning engagement among university students . Independent learning itself has been shown to develop critical skills such as self-discipline, time management, and problem-solving, all of which are essential for both academic and professional success .

In the context of the Republic of Uzbekistan, the relevance of this topic is closely linked to ongoing educational reforms aimed at modernizing higher education and aligning it with international standards. The introduction of the credit-modular system, expansion of independent learning hours, and increasing use of digital platforms have significantly enhanced the role of students' самостоятельная учебная деятельность. However, these changes also require students to possess strong motivational and self-regulatory competencies to effectively manage their learning process. Without these psychological mechanisms, the potential benefits of modern educational reforms may not be fully realized.

Moreover, the transition from teacher-centered to student-centered education in Uzbekistan highlights the necessity of developing internally motivated, autonomous, and self-regulated learners. As independent learning becomes a dominant form of education, the ability of students to set goals, plan, monitor, and evaluate their own learning activities becomes a critical determinant of educational quality and outcomes.

In conclusion, the relevance of this topic lies in its direct connection to global educational trends, labor market demands, and national educational reforms. Understanding the psychological factors of motivation and self-regulation in independent learning not only contributes to improving academic performance but also supports the development of lifelong learners capable of adapting to the challenges of the modern world.

Introduction. In the context of rapid globalization, digital transformation, and the transition toward knowledge-based economies, higher education systems worldwide are undergoing significant changes. One of the most important shifts is the move from teacher-centered instruction to student-centered and independent learning models, where learners are expected to actively construct knowledge, regulate their own learning processes, and demonstrate high levels of autonomy. As a result, the psychological factors of motivation and self-regulation have become central to understanding students' academic success and long-term development.

At the global level, higher education has expanded dramatically over the past decades. According to UNESCO data, more than 260 million students are currently enrolled in higher education worldwide, reflecting increased access to education but also raising concerns about quality and effectiveness. In such conditions, simply providing access is not sufficient; students must be equipped with the ability to learn independently, manage their time, and maintain consistent engagement in the learning process. This has led to increased attention to self-regulated learning (SRL) as a key competence in modern education.

Research in educational psychology consistently demonstrates that motivation is a primary driving force behind learning behavior. Students with high intrinsic motivation tend to show greater persistence, deeper engagement, and better academic outcomes compared to those driven primarily by external factors. At the same time, self-regulation enables learners to translate motivation into effective action through processes such as goal setting, strategic planning, monitoring progress, and reflecting on outcomes. Studies by Zimmerman and other scholars indicate that students who

actively use self-regulation strategies achieve significantly higher academic performance and demonstrate stronger problem-solving abilities.

The increasing integration of digital technologies in education further emphasizes the importance of these psychological factors. Online learning environments, learning management systems, and AI-based educational tools require students to independently organize their learning activities without constant external supervision. In such contexts, the absence of strong motivation and self-regulation skills often leads to reduced engagement and lower academic achievement. Therefore, the effectiveness of modern educational technologies largely depends on students' psychological readiness to manage their own learning.

In Uzbekistan, the relevance of this issue is closely linked to ongoing reforms in higher education. Over the past decade, the number of higher education institutions has significantly increased, and the enrollment rate has grown from approximately 9% to over 40%, reflecting expanded access to tertiary education. At the same time, the introduction of the credit-modular system has increased the share of independent learning hours, requiring students to take greater responsibility for their educational progress. These reforms align with international standards but also highlight the need to develop students' internal motivation and self-regulatory competencies.

Furthermore, national educational strategies emphasize the preparation of independent, competitive, and lifelong learners capable of adapting to rapidly changing professional environments. This requires not only subject knowledge but also psychological readiness for Literature Review

The problem of psychological factors influencing motivation and self-regulation in students' independent learning activities has been widely explored within both Russian and international psychological and pedagogical traditions. The existing body of research demonstrates that independent learning is not merely a didactic form but a complex psychological process determined by internal motivation, cognitive strategies, and self-regulatory mechanisms. A comprehensive analysis of scientific literature reveals that motivation and self-regulation function as interrelated constructs that jointly determine the effectiveness of students' learning behavior.

Within the Russian psychological school, the theoretical foundations of this issue are closely connected with the cultural-historical approach of L.S. Vygotsky, who emphasized the social nature of cognitive development. According to Vygotsky, learning occurs through interaction and

is internalized as higher psychological functions. In the context of independent learning, this implies that students gradually move from externally guided activity to self-directed regulation of their cognitive processes. His concept of the "zone of proximal development" is particularly relevant, as it explains how learners develop autonomy when engaged in tasks that challenge their current abilities but remain achievable with appropriate support. Thus, independent learning emerges as a stage where internal motivation and self-regulation replace external control.

A.N. Leontiev's activity theory further develops this perspective by highlighting the role of motivation as the driving force of human activity. He argued that any activity is structured around motives, goals, and actions, and that meaningful engagement occurs only when learners perceive personal relevance in the task. In independent learning contexts, this suggests that intrinsic motivation plays a decisive role in sustaining effort and engagement. Without internal motives, students are less likely to effectively regulate their learning processes. Therefore, motivation is not only a prerequisite but also a structural component of self-regulated learning.

S.L. Rubinstein's subject-activity approach also contributes significantly to understanding independent learning. He viewed the individual as an active subject capable of transforming reality through purposeful action. From this perspective, self-regulation is an expression of the learner's subjectivity, reflecting the ability to consciously plan, monitor, and evaluate one's own activity. Independent learning, therefore, is not simply an instructional requirement but a manifestation of the learner's active position in the educational process.

The works of D.B. Elkonin and V.V. Davydov, representatives of the developmental learning theory, further emphasize the importance of cognitive activity and theoretical thinking. They argue that effective learning occurs when students engage in problem-solving and conceptual understanding rather than mechanical memorization. Such learning environments stimulate both motivation and self-regulation, as students are required to actively construct knowledge and reflect on their cognitive processes. This aligns with the idea that independent learning fosters deeper understanding and long-term retention.

In international research, J. Zimmerman's theory of self-regulated learning provides one of the most comprehensive frameworks for analyzing students' independent learning behavior. Zimmerman conceptualizes self-regulation as a cyclical process involving forethought (goal setting and planning), performance (monitoring and strategy use), and self-reflection (evaluation and

adjustment). His empirical studies demonstrate that students who effectively apply self-regulation strategies achieve higher academic success and exhibit greater persistence in learning tasks. This model highlights the dynamic interaction between cognitive, motivational, and behavioral components of learning.

E. Deci and R. Ryan's Self-Determination Theory (SDT) offers a deeper understanding of motivation in independent learning contexts. According to SDT, intrinsic motivation arises when three basic psychological needs-autonomy, competence, and relatedness-are satisfied. In higher education, independent learning environments that support autonomy encourage students to take responsibility for their learning, thereby enhancing both motivation and self-regulation. Conversely, controlling or overly structured environments may undermine intrinsic motivation and reduce students' engagement.

A. Bandura's social cognitive theory, particularly the concept of self-efficacy, also plays a crucial role in explaining students' independent learning behavior. Bandura posits that individuals' beliefs in their capabilities influence their motivation, effort, and persistence. Students with high self-efficacy are more likely to engage in challenging tasks, apply effective learning strategies, and regulate their behavior in the face of difficulties. Thus, self-efficacy serves as a mediating factor between motivation and self-regulation.

Furthermore, M. Csikszentmihalyi's concept of "flow" provides insight into optimal learning experiences. According to this theory, individuals become fully engaged in an activity when there is a balance between challenge and skill level. In independent learning, tasks that are neither too easy nor too difficult can induce a state of deep concentration and intrinsic enjoyment, which enhances both motivation and self-regulatory capacity. This suggests that the design of learning tasks plays a critical role in activating students' internal resources.

In addition, research by Pintrich and Schunk emphasizes the role of goal orientation and motivational beliefs in self-regulated learning. Their work demonstrates that students with mastery-oriented goals are more likely to adopt deep learning strategies, persist in the face of challenges, and regulate their learning effectively. This further confirms that motivation is not a static trait but a dynamic system influenced by contextual and psychological factors.

Overall, the analysis of Russian and international literature indicates that motivation and self-regulation are inseparable components of independent learning. Russian scholars primarily focus

on the activity-based and developmental aspects of learning, emphasizing the transformation of external regulation into internal control. In contrast, international research provides detailed models of self-regulation, motivation, and their interaction within learning processes. The integration of these perspectives allows for a more comprehensive understanding of independent learning as a psychologically complex and dynamically regulated activity.

Thus, the literature consistently supports the conclusion that enhancing students' motivation and self-regulation is essential for improving the effectiveness of independent learning. These psychological factors not only determine academic performance but also contribute to the development of lifelong learning skills, adaptability, and professional competence in a rapidly changing world.

Continuous self-development. However, practical observations indicate that not all students possess sufficient levels of motivation and self-regulation, which can limit the effectiveness of independent learning activities.

From a psychological perspective, motivation and self-regulation are deeply interconnected processes. Motivation provides the energy and direction for learning, while self-regulation ensures that this energy is effectively organized and sustained over time. Together, they form the foundation of autonomous learning behavior, which is essential in modern higher education.

Thus, the study of psychological factors influencing motivation and self-regulation in students' independent learning activities is not only theoretically significant but also has important practical implications. It contributes to improving the quality of higher education, enhancing student engagement, and preparing individuals who are capable of lifelong learning and professional self-development in a dynamic global environment.

Discussion. The findings of this study confirm that motivation and self-regulation act as core psychological mechanisms determining the effectiveness of students' independent learning activities. In modern higher education, where the emphasis increasingly shifts toward autonomy and learner-centered approaches, the ability of students to organize, control, and sustain their own learning processes becomes a decisive factor of academic success. The analysis demonstrates that independent learning is not merely a formal requirement within the curriculum but a complex, internally driven activity that depends on the interaction between motivational and regulatory processes.

One of the key outcomes of the discussion is the strong interdependence between intrinsic motivation and self-regulation. Students who are internally motivated tend to demonstrate higher levels of engagement, persistence, and cognitive involvement in learning tasks. They approach independent learning not as an obligation but as an opportunity for self-development and intellectual growth. This internal orientation encourages them to set meaningful goals, explore diverse learning strategies, and actively monitor their progress. In contrast, students who rely primarily on external motivation often show limited initiative and lower levels of self-regulatory behavior, which negatively affects the quality of their learning outcomes.

The study also highlights the crucial role of self-regulation as a mediator between motivation and actual learning performance. Even when motivation is present, without the ability to plan, organize, and evaluate one's actions, learning remains ineffective. Self-regulated students are capable of structuring their study time, selecting appropriate strategies, and adjusting their behavior based on feedback and reflection. This dynamic process transforms motivation into tangible academic results. Therefore, self-regulation should be viewed not only as a cognitive skill but also as a psychological system integrating motivation, metacognition, and behavioral control.

Another important aspect revealed in the discussion is the role of reflection in enhancing independent learning. Reflective practices enable students to critically analyze their strengths and weaknesses, identify learning gaps, and refine their strategies. Through reflection, learners develop a deeper understanding of their cognitive processes and become more conscious of their learning behavior. This awareness strengthens their autonomy and contributes to the formation of a sustainable learning trajectory. Consequently, reflection acts as a key mechanism linking self-regulation with continuous personal and academic development.

The influence of self-efficacy and emotional factors also emerges as a significant dimension in independent learning. Students who believe in their capabilities are more likely to take initiative, engage in challenging tasks, and persist despite difficulties. On the contrary, low self-confidence often leads to avoidance behavior and reduced effort. Emotional regulation further supports self-regulated learning by helping students manage stress, maintain focus, and cope with academic challenges. Thus, motivation, self-regulation, and emotional stability together form an integrated system that determines the effectiveness of independent learning.

The discussion further indicates that the educational environment plays a critical role in shaping these psychological factors. Learning environments that promote autonomy, provide meaningful feedback, and encourage active participation significantly enhance both motivation and self-regulation. Innovative teaching methods, such as problem-based learning, project-based learning, and interactive digital tools, create conditions in which students are required to take responsibility for their own learning. In such contexts, independent learning becomes a natural extension of the educational process rather than a separate requirement.

At the same time, the expansion of digital education introduces both opportunities and challenges. While digital platforms provide access to vast learning resources and flexible learning pathways, they also require students to possess high levels of self-discipline and time management skills. Without adequate self-regulation, students may struggle with procrastination, distraction, and ineffective learning strategies. Therefore, the success of digital and blended learning models largely depends on the development of students' motivational and self-regulatory competencies.

Overall, the discussion demonstrates that motivation and self-regulation are not isolated variables but interconnected elements of a unified psychological system that underlies independent learning. Their interaction determines the depth of cognitive engagement, the sustainability of learning efforts, and the overall quality of educational outcomes. Strengthening these factors is essential for fostering autonomous learners who are capable of adapting to the demands of modern education and the labor market.

In conclusion, the development of motivation and self-regulation should be considered a strategic priority in higher education. By creating supportive learning environments, integrating psychological principles into teaching practices, and promoting reflective and autonomous learning, educational institutions can significantly enhance the effectiveness of students' independent learning activities and prepare them for lifelong learning and professional success.

Conclusion. The conducted analysis demonstrates that the psychological factors of motivation and self-regulation play a decisive role in ensuring the effectiveness of students' independent learning activities. In the context of modern higher education, where autonomy, flexibility, and lifelong learning have become essential requirements, these factors are no longer supplementary but constitute the core of successful academic engagement. Independent learning

can only be productive when it is supported by strong internal motivation and well-developed self-regulatory skills.

The findings confirm that intrinsic motivation serves as the primary driving force that initiates and sustains students' learning behavior. When students perceive learning as meaningful and personally relevant, they are more likely to engage deeply with academic tasks, demonstrate persistence, and seek new knowledge beyond formal requirements. This internal orientation transforms learning from a passive reception of information into an active, purposeful, and self-directed process.

At the same time, self-regulation acts as the operational mechanism that translates motivation into effective learning outcomes. Through goal setting, planning, monitoring, and reflection, students are able to organize their cognitive and behavioral resources in a structured and purposeful manner. The development of these skills enables learners to manage their time efficiently, overcome difficulties, and continuously improve their performance. Thus, self-regulation ensures the sustainability and effectiveness of independent learning over time.

An important conclusion of the study is that motivation and self-regulation function as an integrated psychological system. Neither factor alone is sufficient to guarantee successful independent learning; rather, their interaction determines the level of student engagement and academic achievement. High motivation without self-regulation may lead to inconsistent efforts, while strong regulatory skills without motivation may result in superficial or mechanical learning. Therefore, a balanced development of both components is essential.

The study also highlights the significant influence of educational environments on these psychological processes. Learning contexts that support autonomy, encourage initiative, and provide constructive feedback foster higher levels of motivation and self-regulation. Innovative pedagogical approaches, including problem-based learning, project-based learning, and the use of digital technologies, create conditions that stimulate students' active participation and responsibility for their own learning. However, these approaches are effective only when accompanied by deliberate efforts to develop students' psychological readiness for independent learning.

Furthermore, the increasing role of digital education underscores the necessity of strengthening students' ability to self-regulate their learning. In technology-rich environments,

where external control is minimized, students must rely on their internal resources to maintain focus, manage time, and achieve learning goals. This makes the development of motivation and self-regulation not only an educational objective but also a key life competence.

In conclusion, enhancing the psychological foundations of motivation and self-regulation is essential for improving the quality of higher education and preparing students for the challenges of a rapidly changing world. By fostering autonomous, motivated, and self-regulated learners, higher education institutions can contribute to the development of individuals who are capable of continuous learning, professional growth, and effective adaptation in dynamic social and economic environments.
